Adiabatic Cooling System

Adiabatic Condensers GVW/GVD
for HFCs, CO₂ and NH₃
Adiabatic Coolers GFD/GFW
for CO₂, water/glycol and other media

5 Tons – 400 Tons

With hydroBLU™ technology
Güntner’s Adiabatic Cooling System with hydroBLU™ Technology

Wet When You Need It & Dry When You Don’t

Efficient heat rejection is an economic success factor in any industry, particularly in air-conditioning, refrigeration, process cooling and data center applications. Water consumption is an ever increasing important criterion for choosing equipment in addition to the footprint, low investment, low operating costs and low noise emission. The growing scarcity of water and rising costs of water inspire us to offer eco-friendly products to help minimize natural resource consumption.

The Güntner Adiabatic Cooling System (ACS) with hydroBLU™ Technology is an advanced cooler or condenser utilizing the latest in heat transfer and controls technology. By using water only on peak days, the ACS cooler/condenser can often reduce water consumption to 20% of a conventional water cooled system and reduce peak energy demand versus a dry system. A system that is wet when you need it and dry when you don’t, the ACS combines the reliability and ease of use of a dry cooler/condenser with system efficiencies associated with water cooled equipment.

The Adiabatic Cooling Delivery System utilizes a water management system and cooling pads to maximize adiabatic efficiency, minimize water consumption and safely manage water usage. In addition to the ease of operation, elimination of water treatment systems is typically applicable. The coils remain dry and effective water management helps to mitigate the proliferation of Legionella, pneumophila and associated illness.

The Adiabatic Cooling System offers an energy efficient solution that provides dramatic water savings relative to water cooled equipment by utilizing water only when ambient temperatures and system demand require it.
Adiabatic Dry Coolers

At peak ambient temperatures, the air entering the finned heat exchanger is pre-cooled by wetted cooling pads to a temperature approaching the wet bulb temperature, without aerosol formation and without applying water to the finned surface. The pre-cooling process maintains the required leaving fluid temperatures or condensing temperatures at peak ambient conditions. The adiabatic process significantly increases the thermal efficiency of the cooler or condenser with minimal water usage.

The increased thermal performance at peak ambient conditions lowers the total cost of ownership. The reduction in compressor energy usage permits higher COP’s, with a significantly reduced footprint.

Cooling towers or evaporative condensers use water as the evaporative cooling source throughout the year. The adiabatic alternative only uses water at peak ambient conditions thereby significantly reducing water usage, water treatment, chemicals, sewage and the costs associated with each.
Tailored solutions for any application

**Intelligent control of fan speed and wetting**
- Water conserved by volume control
- Very low energy consumption using Electronically Commutated (EC) fans
- Very low water consumption because dry/wet switchover is set at a high level

**Optimal adiabatic cooling delivery system**
- Maximum adiabatic efficiency
- Plume-free
- No water circulation
- No aerosol output
- Automatic draining
- Dry cooling coil
- No spraying
- No water treatment required on typical systems

**Multifunctional use of humidification pads**
- Easily removed for dry operation
- Reliable adiabatic delivery system
- Protects coil from dirt and debris

**Integrated, intelligent control**
- Wired ready to use
- EC fans with the Güntner Motor Management (GMM) fan speed controller
- GMM step controller for fan cycling

**Installation**
- Easily rigged by crane thanks to easily accessible lifting lugs
- Quick and easy installation
- Optimal distribution of forces
- Rigid structure, resistant to deflection

**Dry operation**
- With no wetting of the unit, it operates like a conventional finned dry cooler or condenser
- Energy is dissipated to the ambient air via convection

**Wet operation**
- For high external temperatures and/or during higher cooling loads
- The fluid can be brought down below the ambient dry bulb temperature, even without directly wetting the heat exchangers
- Air is adiabatically cooled and then energy dissipated by convection

**Minimal number of support feet**
- High level of static stability
- Reduced installation costs

**High power density**
- V construction
- Optimized shipping dimensions

**Ease of Use**
- Maintenance free motors
- Easy access for cleaning
- Easily removable pads
Dry or wet operation

Adiabatic operating principle

Güntner's ACS coolers or condensers with hydroBLU™ Technology can be operated either wet or dry.

Both modes can provide excellent drycooler or condenser performance with a small footprint and low operating costs. The cooling limit, i.e. the theoretically best possible return temperature condensing pressure for the ACS is tied to the wet bulb temperature of the ambient air at the drycooler/condenser.

Our experts will configure the ACS specifically for your application and optimise it for its intended operation in your system. This is the only way of ideally dimensioning the drycoolers or condensers and minimising the operating costs of the complete system. Benefit from our experience!

Numerous possible combinations

- Various combinations of materials
- Configurable tube materials and geometries
- Various tubeside circuit options
- Various fin spacings possible

Maximum capacity range

- Capacity range from 5 - 400 tons
- Multitude of sizes to match application
The efficient operation of adiabatic dry coolers depends very much on the intelligence and strategy of their functional control. The built-in control continually monitors all the significant parameters and automatically adapts the operating mode to the current system requirements. This guarantees a smooth and efficient unit operation and compliance with the predicted consumption values.

The GHM & GMM are designed as programmable logic controllers and allow for:
- Control the fluid outlet temperature
- Water distribution management
- Output of operational and fault signalling
- Communication with building management systems

**Customer benefits from our controller**
- Optimized operation of individual units
- Parameters can easily be set for ideal use in a variety of applications
- Low operating costs
- Easily integrated into your building management system by conveying operational messages via contacts or a bus system
- Easy to install, supplied ready for connection
- Compact, adaptable and expandable

**GMM – Energy-Efficient Intelligence for all Areas**

The GMM system is available for AC or EC fans. A number of different technologies are used, but one feature is common to all management systems. They are equipped with a number of functions that serve to enhance energy efficiency.

Water Conservation

Epoxy coating

The service life of finned heat exchanger depends on localized conditions and concentrations of airborne elements. The service life of these heat exchangers can be significantly increased by using epoxy-coated fins. Epoxy resin is a thermosetting plastic which, once hardened, exhibits high strength and chemical resistance.

Coil options

Available with copper tubes or stainless steel tubes for use with CO₂, ammonia, halocarbons, hydrocarbons, glycols, brines or water.

Additional Options for your Adiabatic Cooling System

Annual Usage:
Adiabatic in Water Priority Mode
400 Ton System
Annual water and energy cost:
Adiabatic: $173,000
Evaporative: $205,000

Evaporative vs. Adiabatic analysis

Below is an example of Evaporative vs. Adiabatic analysis for Binghamton, NY, illustrating cost savings based on water and electrical consumption.

Annual Usage:
Evaporative Cooler/Condenser

Power and Water Rates:
Electricity rate $0.10 / kWh
Demand charge $11.00 / kW / mo.
Water & sewage $8.00 / kgal
Water treatment $4.00 / kgal

Technical data for the ACS

Dimensions (approx. range) 6’5” - 40’ (L) x 4’4” - 8’6” (W) x 5’6” - 9’5” (H)
Weight empty 1,000 - 19,000 lbs
Heat exchanger design Floating coil principle
Certification and marks Quality standard ISO 9001, UL, ETL, CRN, and ASME U Stamp upon request
Transport/delivery • Delivered assembled
• Lifting lugs allow for simple unloading and rigging
• Plastic wrapped to protect against inclement weather
Safety • Operational reliability and leak prevention thanks to the floating coil principle.
• Minimize the possibility of Legionella due to zero aerosol formation.
• No stagnant water accumulation as water distribution system is one through.
Maintenance Minimal maintenance, no water treatment requirements under typical circumstances, zero chemicals.
Installation • Small footprint, high capacity
• Integrated factory installed controls
